A 30° Bevel or a 45° Bevel?

The bevel angle of a pick guard is based off how a router bit would be read. When a router bit has a certain angle it is based of the center axis or parallel to the bit shank and the degrees move away from that vertical plane.

0° = No Bevel
30° = slight bevel
45° = Maximum bevel angle we cut on a pick guard revealing the most striping or solid color edge.
